

# ENERGY MANAGEMENT SYSTEMS

**Energy Management Systems** can guarantee 5% - 20% savings on your energy usage. As the demand for power travels through your business, there is non-productive current (heat) that strains your equipment and the current across the three phase system. By allowing fewer amps (heat) going to the neutral bar through improving the efficiency of your electrical system less energy is wasted. By improving the sign wave, current and volts are brought closer together which lowers the 300% - 600% start up amps required when an inductive motor turns on. The three costly characteristics that cost electrical end users and damage the electrical equipment are: poor power factor, harmonic interference and transient surges and spikes. Customizing management systems to deal with these characteristics balance out the entire system resulting in lower electric bills along with a decrease in the need to repair electrical equipment. We have a system available for all size businesses and buildings.

## Sign & Save - No Financial Risk - Fully Guaranteed

- \$0 down
- \$0 deposit
- 100% tax deductible
- 2 year lease-purchase plan - customer pays out of monthly savings - staying cash positive throughout payment period
- 15 month payback guaranteed/backed with insurance policy
